Mission

L'entreprise Place de marché souhaite lancer une marketplace e-commerce.

Les vendeurs y proposent des articles en postant une photo et une description.

Ils attribuent eux-mêmes les **catégories des articles**, et cela de manière peu fiable.

L'entreprise souhaite étudier la faisabilité d'un moteur de classification des articles en différentes catégories, avec un niveau de précision suffisant.

Les données fournies

'Place de marché fourni un fichier compressé :

- Un fichier .csv (1050, 15).
- Un dossier: 1050 photos.

Analyse des données

15 variables disponibles 4 variables sélectionnées

t-SNE according to predicted clusters

Conclusion

Le score de similarité final obtenu a partir des images et des descriptions afin de permettre de regrouper les produits de mêmes catégories n'a pas été suffisamment satisfaisant pour prétendre a une réelle efficacité de cette approche de modélisation.
